To Motors MS is context based and evaluates the merit of the FS recommendation given the Meta current reality. If it is accepted **System** then the model of the reality is updated, command is sent to A non-context based the motor and reality is recommendation of what to do is compared with the model. If the sent to the MS after the FS has recommendation fails in merit finished deliberating **Expert** the MS queries the KNN System initiating a new thinking cycle. Memories, procedures, best practices, related facts, etc. are sent to the FS based on what is Knowledge remembered in the KNN Node Network An interpretation of the raw signals is passed to the KNN from the NN Neural Network From Sensors
